Clutch Disc

QUALITY APPROVED !

Clutch Disc

We have made a very constructive design change. The central hub section of the clutch has been changed. We have increased the drive contact area from a 4 point load contact to an 8 sided contact area. This allows our clutch to withstand irregular loads and extreme torque. This system also ensures that the centre boss in the hub section is always central, both vertically and horizontally, to the drive force. However, the floating hub is still enabled, but can never dislocate. In conclusion, a product that is very forgiving in extreme drive scenarios.

4 point load contact

8 sided contact area
