Strut mount to fit **BMW E34**

The BMW strut mount has two tasks:

- On the one hand, the chassis spring uses the ball joint to brace itself against the chassis.
- On the other hand, a rubber mount prevents any interfering impulses from being transferred to the chassis. To this end, the middle bushing to the mount housing consists of rubber.

MEYLE's engineers have analysed the reasons why this part fails. In most cases it is not the highly strained ball joint which fails but the rubber-metal interface to the middle bushing. We have therefore changed the design of the rubber interface. In that way we have produced an effective reinforcement to guarantee a far longer service life for this part.
